

Introduction to Catalogs_Plugin v1.00a

27 Sept 2021

This document is a short introduction to Catalogs_Plugin, a Java-based plugin for AstrolmageJ to query on-line photometry databases. The output is an AstrolmageJ-compatible radec file to overlay apertures on plate-solved images.

Version 1.00a supports the VSP and APSS9 on-line catalogs as listed below

Links:

AstrolmageJ:	https://www.astro.louisville.edu/software/astroimagej/
Variable Star Plotter:	https://app.aavso.org/vsp/
VizieR: (hosts APASS9 catalog)	http://cdsarc.u-strasbg.fr/doc/asu-summary.htm

Run plugin from AstrolmageJ toolbar

From the AstrolmageJ toolbar, select Plugins | Catalog Plugin to open the following form:

Catalogs Plugin ONEJAR-1.00a

SIMBAD Query
Save Query Data
Run Catalog Query
Import RaDec File
Save RaDec File

User interface after SIMBAD query on wasp 12

Note: the plugin runs as a modal dialog and must be closed to access other AIJ software.

SIMBAD Query – runs an object name-based query on Simbad on-line database. If a match is found, populates SIMBAD Data section as shown for WASP-12. In this example, no data was returned for R and I magnitude bands.

Save Query Data – saves current Catalog Query settings to disk; reloads saved data when plugin is closed and re-opened

Run Catalog Query – runs an on-line query on the selected catalog (APASS9) with user parameters specified in Catalog Query settings section. The results of a successful query are tabulated on the right of the form, shown in the next section.

Note: Current version (1.00a) limits total number download records to 1500.

Import RaDec File – reads and displays radec file data.

Close – closes plugin, any unsaved data will be lost.

Run an on-line catalog query:

The figure shows the interface after downloading data from the APASS9 catalog. All 70 records matching the specified query parameters are tabulated, sorted by increasing radial distance from the object star.

The screenshot shows the 'Catalogs Plugin ONEJAR-1.00a' window. On the left, there are buttons for 'SIMBAD Query', 'Save Query Data', 'Run Catalog Query', 'Import RaDec File', and 'Save RaDec File'. Below these are 'Update Table', 'Clear', and 'Close' buttons. The 'Catalog Query settings' section includes fields for 'ObjectID' (wasp 12), 'RA' (06:30:32.80), 'Dec' (+29:40:20.27), 'Fov' (10.0 arcmin), 'Limit' (15.0 mag), and 'Catalog' (APASS). The 'SIMBAD Data' section shows 'ObjectID: WASP-12', 'RA: 06:30:32.80', and 'DEC: +29:40:20.27'. The 'Filter Mag' section shows 'MagB: 12.14', 'MagV: 11.57', and 'MagI: .'. The 'Set Mag Limits' section has 'Upper: 0', 'Nominal: 11.5', and 'Lower: 0'. The 'Ascending Sort' section has 'Distance' selected. The 'Nobs (APASS)' section has '1' selected. The 'Total records: 70' and 'Filtered records: 70' are displayed. The main table shows 70 records with columns: Ap, ObjectID, Ra2000, Dec2000, Mag, Mag Err, Mag diff, Dist, Nobs, and USE. The first record is T01, wasp 12, 06:30:32.80, +29:40:20.27, 11.500, 0.000, 0.000, 0.00, 1, and USE. The second record is C02, 06303279+29402033, 06:30:32.79, +29:40:20.33, 11.415, 0.070, -0.085, 0.00, 4, and USE. The table continues with records C03 through C34.

Ap	ObjectID	Ra2000	Dec2000	Mag	Mag Err	Mag diff	Dist	Nobs	USE

User interface after Run Catalog Query

Ap – lists AstrolmageJ aperture id

ObjectID – catalog object identifier.

Since records are not named in the APASS database, the plugin creates a unique identifier formatted HHMMSSSS±DDMMSSSS, as below for Ap C02

Ap	ObjectID	Ra2000	Dec2000
T01	wasp 12	06:30:32.80	+29:40:20.27
C02	06303279+29402033	06:30:32.79	+29:40:20.33

Ra200, Dec2000 – object coordinates

Mag, Mag Err – catalog magnitude values for selected filter band

Mag diff – difference between Catalog and Nominal magnitudes

Dist – radial distance (arcmin) to T01 object; by default, records are sorted by increasing radial distance.

Nobs – number of observations for each record (APASS)

USE – user selects or de-selects record to export to radec file.

Import RaDec File – over-writes current data with radec file data set.

Save RaDecFile – saves selected table data to AstrolImageJ-compatible file

<ObjectId>.<filter>.<fov>.radec.txt

Update Table – see below

Clear – clears table data

Apply user-selected filters and sort order:

The tabulated record count is reduced to 10 records after applying the following filters:

Nominal (target) mag set to 11.5 mag

Mag range: 11.5 ± 1.5

Minimum number of observations: 3

Sort by: $|\Delta \text{Mag}|$, i.e., by the absolute difference in comparison and nominal mag.

The screenshot shows the 'Catalogs Plugin ONEJAR-1.00a' window. On the left, there are buttons for 'SIMBAD Query', 'Save Query Data', 'Run Catalog Query', 'Import RaDec File', and 'Save RaDec File'. Below these are 'Update Table', 'Clear', and 'Close' buttons. The 'Catalog Query settings' section includes fields for 'ObjectID' (wasp 12), 'RA' (06:30:32.80), 'Dec' (+29:40:20.27), 'Fov' (10.0 arcmin), 'Limit' (15.0 mag), 'Catalog' (APASS), and 'Filter' (SR). The 'SIMBAD Data' section shows 'ObjectID: WASP-12', 'RA: 06:30:32.80', and 'DEC: +29:40:20.27'. The 'Filter Mag' section shows 'MagB: 12.14', 'MagV: 11.57', and 'MagI: .'. The 'Set Mag Limits' section has 'Upper: 1.5', 'Nominal: 11.5', and 'Lower: -1.5', with a checkbox for 'Apply mag limits'. The 'Ascending Sort' section has 'Distance' and 'Delta Mag' (selected) options. The 'Nobs (APASS)' section has a value of 3. The table on the right has columns: Ap, ObjectID, Ra2000, Dec2000, Mag, Mag Err, Mag d1ff, Dist, Nobs, and USE. It displays 10 records, with the first two (T01 and C02) de-selected (checkboxes are empty) and the remaining eight selected (checkboxes are checked). The status bar at the bottom indicates 'Total records: 70' and 'Filtered records: 10'.

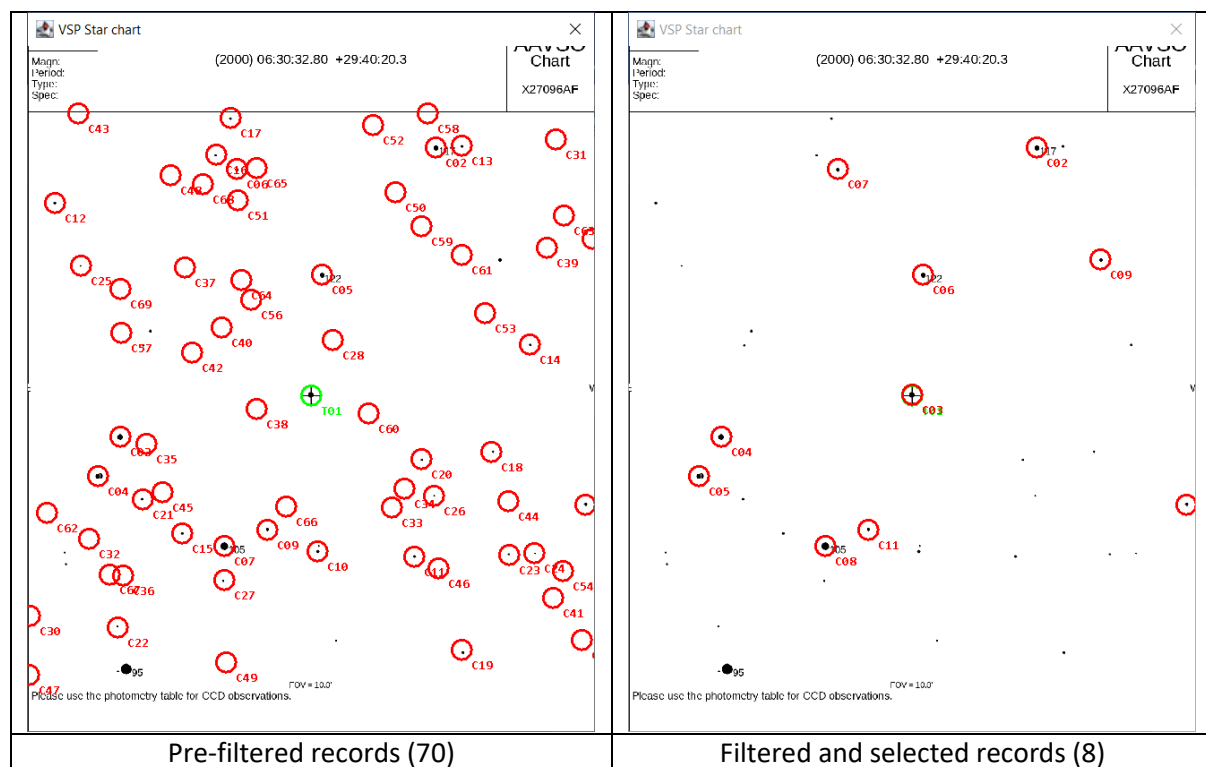

Ap	ObjectID	Ra2000	Dec2000	Mag	Mag Err	Mag d1ff	Dist	Nobs	USE

C10	06301050+29382465	06:30:10.50	+29:38:24.65	12.945	0.073	1.445	5.21	4	<input checked="" type="checkbox"/>

User interface after applying magnitude and Nobs filters

Update Table – applies selected sort order, magnitude and Nobs filter, selecting 10 of 70 records in this example.

USE – the figure shows two de-selected records with Ap column automatically entries updated accordingly.

VSP Chart

The left figure shows VSP chart opened after running a catalog query and the right figure after applying filter and user selections.

Save Radec File - saves the right-hand data set to a text file: wasp_12.SR.010.radec.txt

Example workflow

Open Catalogs_Plugin, enter ObjectId and run SIMBAD query to download coordinates and available magnitude data.

Input other Catalog Query settings and enter an estimate Nominal magnitude for this object, e.g., based on SIMBAD magnitude for that filter band.

Run Catalog Query to download all records matching query parameters. Set magnitude and Nobs (APASS catalog) filters and run Update as necessary until roughly 10 table records are displayed.

Review table and chart data to select or de-select table records. For example, in the filtered chart above, de-select C03 (overlaps target object) and (optionally) de-select the object at right edge of FOV.

Save chart data to radec file – the software automatically assigns filename with query-based format in radec subfolder.

Close Catalogs_Plugin, open a plate-solved image in AIJ image viewer, then import and over-lay apertures (File | Import Apertures from RA/DEC list ..., navigate to and select radec file).

Option: to change selected aperture, re-open Catalogs_Plugin, run Import Radec File and open saved radec file to import table records. De-select any unwanted apertures and save changes.

Note: Save RaDec File over-writes without warning any radec file for the same query settings.
